SUMMARY

Driven systems-oriented software engineer with experience building and managing complex data pipelines and distributed systems. Strong background in working with large-scale data, and improving the efficiency, reliability, and scalability of workflows. Looking for opportunities to contribute in real-world production systems while continuously grow as an engineer.

EDUCATION

Bachelor of Science: Computer Science

University of Wisconsin, Madison

Madison, WI

2022-2026

PROJECTS/EXPERIENCE

GE Healthcare: Log Analytics Platform (*Backend Engineer*)

Jan 2026 - May 2026

- Managed the design and implementation of a complex ingestion pipeline, applying **Agile (Scrum) workflows** in **JIRA** to structure iterative development, track process, and improve delivery efficiency.
- Refactored the legacy ingestion pipeline built on **Elasticsearch** into a **modular architecture** using **OpenSearch**, ensuring schema consistency and long-term maintainability for end users.
- Optimized a high-throughput data processing pipeline by decoupling raw file storage from queryable logs, **improving processing time by 50%** and reducing system load.
- Worked directly with mentors to conduct user interviews and incorporate feedback to design a clean, intuitive interface for technical and non-technical users alike, improving usability.

Linked UP (*Full-Stack Engineer*)

Nov 2025 – Jan 2026

- Led a team of 3 engineers in the design and delivery of an Android application supporting real-time communication and user matching for UW students.
- Implemented a scalable **MVVM** architecture in **Kotlin**, enforcing consistent state management and modularizing components to improve maintainability and support future feature expansion.
- Identified and resolved performance bottlenecks by redesigning early-stage workflows, improving application responsiveness and **reducing crash rates by ~25%** under high user load.

Loan Management System

Dec 2025

- Designed and deployed a fault-tolerant distributed data system that enables fast, reliable retrieval of large-scale loan records via a **gRPC-based** client-server architecture.
- Using **HDFS** with **SQL-backed metadata**, ensured high availability and durability of datasets even under conditions of node failure, giving for a fault-tolerant storage layer.
- Optimized search performance by partitioning then caching query results into Parquet files, reducing the need for repeated full-dataset scans and latency response times for common queries.
- Leveraged **WebHDFS REST API** as well as **HDFS replication** to better handle data loss scenarios, doubling system resilience and ensuring consistent, reliable access to loan entries.

TECHNICAL SKILLS

Languages | Python, Kotlin, Java, SQL, C, Javascript/Typescript, HTML, CSS, R

Tools | AWS, OpenSearch, HDFS, Docker, React

Concepts | Fault tolerance, performance tuning, data analysis, process optimization

Other | Google Cloud, Excel, Figma
